High-resolution N-body Simulations of Galactic Cannibalism

THE MAGELLANIC STREAM

Tim Connors*

Dr. D. Kawata

Prof. B. Gibson

*tconnors@astro.swin.edu.au

Swinburne University of Technology

July 9, 2004

[Abstract](#)

Through the investigation of the closest obvious group of interacting galaxies, the Magellanic Clouds and the Milky Way Galaxy, we hope to understand the process of hierarchical clustering in detail.

Best laboratory for study of

- Formation of tidal streams
- Effect of interaction and SNe feedback on SF in **cannibalised dwarfs**.

We are trying to construct self-consistent chemo-dynamical model of SMC in particular

Best laboratory for study of

- Formation of tidal streams
- Effect of interaction and SNe feedback on SF in **cannibalised dwarfs**.

We are trying to construct self-consistent chemo-dynamical model of SMC in particular

First, this study allows us to hunt down allowable parameters

We investigate how **pure tidal forces** influence stream, and find what the formation process of Magellanic Stream is

2. N-body simulation of SMC and Magellanic Stream

Backwards integrate orbit using modified Noguchi's (1996) ubiquitous code.
GalactICs produces self-consistent N-body Initial Conditions for the SMC disk in equilibrium

3. Modelling Strategy

A step-by-step model construction

A: N-body model of SMC

N-body is fast: Parameter search required over many undetermined quantities

Almost completed — Connors et al. 2004 already published

B: Include hydrodynamics/Star Formation/Chemodynamical evolution

Based on best model determined in **A**, find **star formation history** within SMC

SNe feedback is most complicated and poorly understood
SMC is **good laboratory** for such study

4. Parameter survey

Best model determined
by **both spatial and
kinematical** agreement
with:

5. Best model: HI column density

Quantitative comparison with observation: **HIPASS** data cube courtesy of Mary Putman; **added Northern Extension:**

Observation \Leftrightarrow Simulation (ZEA coordinates)
Overall features of LAF and MS reproduced

For the first time, actual **quantitative comparisons** reveal problems:

MS and LAF density/length/angle are not perfect

Adding drag (ram pressure from Galaxy halo) may fix these.
